Publication 1

Title	A data-driven approach to predict the success of bank telemarketing
Harvard reference	Moro, S., Rita, P. and Cortez, P. (2014). A data-driven approach to predict the success of bank telemarketing. Decision Support Systems, 62, pp. 22–31.
Link	https://doi.org/10.1016/j.dss.2014.03.001
Modelling	Compared Logistic Regression, Decision Trees, Neural Networks and Support Vector Machines. Feature selection was applied, and models were evaluated using ROC-AUC and cumulative lift with a rolling-window approach.
Preprocessing techniques	Portuguese retail-bank campaign records collected from 2008 to 2013, with client, product and socioeconomic variables. The authors investigated many attributes and selected a smaller set for modelling.
Key takeaways	The target was whether a client subscribed to a long-term deposit after a telemarketing campaign. The study supports comparing multiple models, selecting useful features and evaluating on later data. For STADIOEquities, predictors must be available before the predicted activation event.

Publication 2

Title	A machine learning approach to the digitalization of bank customers: Evidence from random and causal forests
Harvard reference	Carbó-Valverde, S., Cuadros-Solas, P. and Rodríguez-Fernández, F. (2020). A machine learning approach to the digitalization of bank customers: Evidence from random and causal forests. PLOS ONE, 15(10), e0240362.
Link	https://doi.org/10.1371/journal.pone.0240362
Modelling	Used Random Forests, conditional inference trees and causal forests to examine bank customers' digitalisation and factors associated with adoption and use of digital services.
Preprocessing techniques	The study used a comprehensive consumer-finance survey. Its data-availability statement says data can be accessed by request to Funcas Foundation; it is not an openly downloadable public dataset.
Key takeaways	This study is relevant because it examines adoption and use of digital financial services. It suggests that customers can progress from information-based to transactional services and that institutions can tailor digital services to customer preferences. It is supporting literature rather than the dataset for Part B.

Publication 3

Title	The Effect of Banks' IT Investments on the Digitalization of their Customers
Harvard reference	Carbó-Valverde, S., Cuadros-Solas, P.J., Rodríguez-Fernández, F. and EY (2020). The Effect of Banks' IT Investments on the Digitalization of their Customers. Global Policy, 11(S1), pp. 9–17.
Link	https://doi.org/10.1111/1758-5899.12749
Modelling	Examined the relationship between banks' information-technology investments and customers' use of digital financial channels. It is not a direct first-deposit prediction model.
Preprocessing techniques	The paper analyses bank IT investment and customer digitalisation. The publicly available article summary does not establish that a ready-to-use, openly downloadable row-level dataset is supplied.
Key takeaways	The study supports the business relevance of digital onboarding and engagement in financial services. It helps explain why digital access and channel use matter, but does not provide the public dataset for Part B. Its findings should not be transferred numerically to STADIOEquities.

Public dataset description

Name	UCI Bank Marketing dataset — bank-full.csv
Harvard reference	Moro, S., Rita, P. and Cortez, P. (2014). Bank Marketing [Dataset]. UCI Machine Learning Repository. https://doi.org/10.24432/C5K306.
Link	https://archive.ics.uci.edu/dataset/222/bank+marketing
Number of instances	45,211 rows in bank-full.csv. UCI also provides a smaller sample and another dataset variant; one version should be used consistently.
Number of feature columns	17 columns in bank-full.csv: 16 input features and the target variable y.
Number of classes	2: yes and no, indicating whether the client subscribed to a term deposit.
Target range	Not applicable; this is a binary classification task.
Origin	Records from direct-marketing phone campaigns at a Portuguese banking institution. The target indicates whether a client subscribed to a term deposit.
Relevance and limitation	This public financial-services dataset is more relevant to banking than telecom churn. However, term-deposit subscription after a marketing campaign is not the same as first-time funding of a newly registered STADIOEquities account. Use it to test a modelling workflow, not as direct evidence about STADIOEquities customers.
